

# CSE 560 Project Milestone 1 (Mar. 6<sup>th</sup>, 2022)

## 1. Project Detail

- Project Name: Flight Delay Information
- Team Name: dbql kicks in
- Members:
  - Sungjoon Park (spark55)
  - Dennis Mulumbi Kyalo (dkyalo)
  - Sol Jang (soljang)

## 2. Problem Statement

- Description of the problem
  - Motivation

The flight schedule is basically affected by various factors such as weather, aircraft safety check, administration, excess demand, etc. As such, flights are more likely to be delayed than on-time transportation such as trains. Unexpected changes in the flight schedule can cause inconvenience to customers using flights. In this regard, our main purpose is to build a database for our target users so that they can take flight delay information into account before they make decisions.
  - Problems
    - How to query the flight list in which conditions such as time, carrier, journey, weather, etc. match a customer's flight plan
    - How to enable customers to query seasonality of delay data in terms of 'day of week', 'month', 'time of day', etc.
    - How to query for comparison in which customers can compare various travel plans depending on the conditions in the first problem and choose the optimal one
- The comparison between DB systems and excel files
  - Data Purpose
    - While Excel files are great for numeric and text values in relatively low volume, DB systems expertly handle not only those but also easily incorporate other types of information, such as images and documents. In addition, DB systems can accommodate high volume and large file size data downloads like those from data loggers, GPS devices, cameras, drones, and other collection devices.
  - Data Volume
    - For long-term projects with numerous monitoring locations, millions of data points can be generated. Because DB systems more efficiently can store and handle volumes of information that would be unmanageable in

Excel files. In particular, spreadsheets have record limitations unlike DB systems and require a larger amount of hard-drive space for storage.

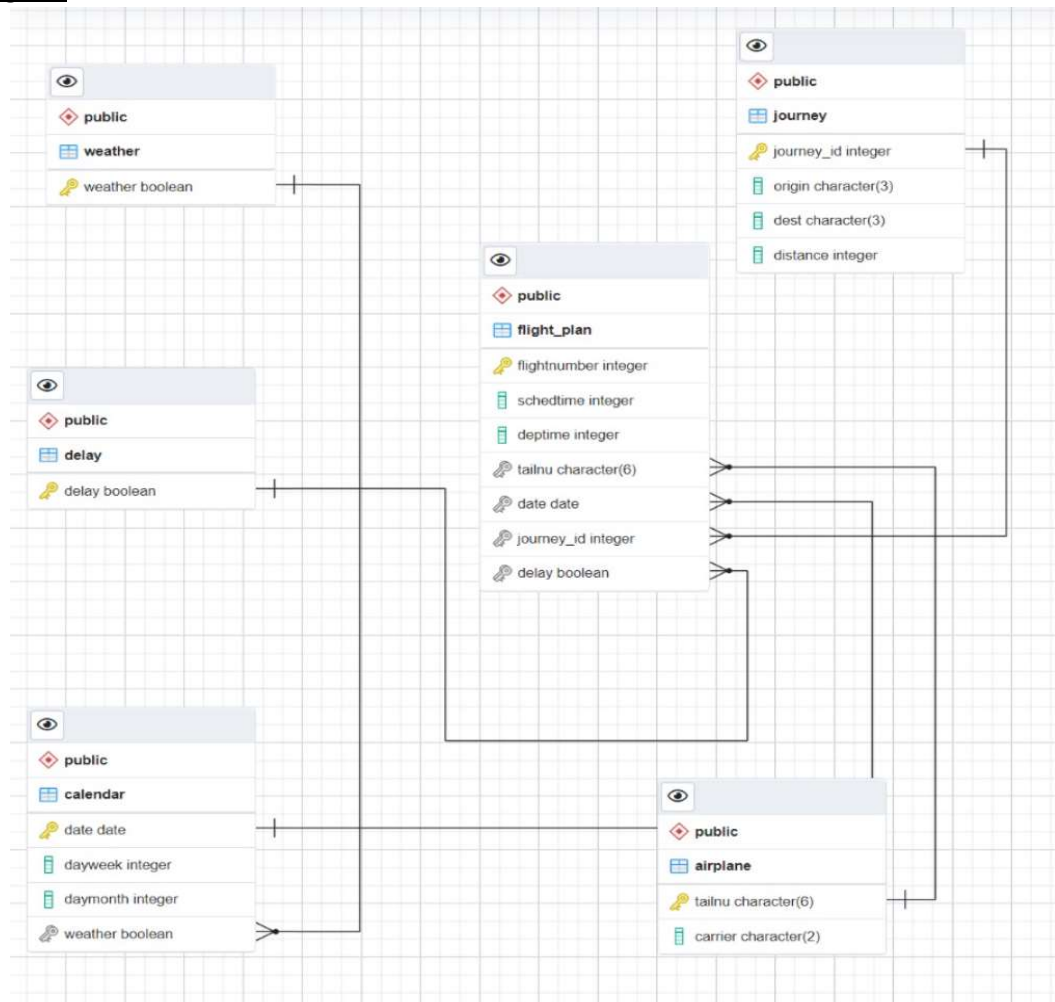

- Editing
  - Updates to databases are typically easier than spreadsheets, especially if the same information is maintained in multiple records or spreadsheets. In addition, a database can update records in bulk.
- Data Accessibility
  - Although data in spreadsheets can be sorted and filtered, a database has broad querying functionality that can retrieve all records matching select criteria, cross-reference records in multiple tables, and perform complex aggregate calculations across multiple tables.
  - When data are maintained in a centralized relational database, data is easily accessible for querying, analysis, and reporting. Since the database will enforce the same quality standards for any dataset, decisions can be made with confidence.
- Speed
  - Databases are designed to refer to information without loading all the information into memory, unlike spreadsheets.
- Data Integrity
  - Data integrity is a key difference between databases and spreadsheets. Relational databases follow standardized integrity rules to ensure that the data they contain are accurate and accessible.
- Redundancy
  - The database structure also avoids data redundancy. Frequent data in spreadsheets are copied multiple times and the same data are maintained in separate spreadsheet files, creating a nightmare to ensure accurate data when a change is required.
- Error Proliferation
  - Preventing and efficiently identifying data errors in spreadsheets is challenging. It is also much easier to accidentally overwrite or delete data in a spreadsheet than in a database.
- User Access and Security
  - Unlike spreadsheets, modern relational databases are designed for multiple users. Moreover, databases provide centralized data storage and offer better security. User permissions can be assigned to view data, edit data, and restrict access to privileged information.

### 3. Target User

- The user
  - People who book a flight (commuters, travelers)
  - Travel agencies
  - Logistics companies using air freight but without their own airplanes
- The administer

- Airport administrative organization
- Real-life scenario description
  - When travelers or travel agencies book flight tickets, they are worried that the aircraft would depart on time. They can reduce the probability that their flight is delayed by avoiding certain conditions such as certain time, carrier.
  - Moreover, customers like logistics companies will be able to prevent problems caused by aircraft delays in advance. For example, plans may be established in advance by considering the delay time in cases flight departure delays are frequent.
  - Regardless of whether a customer is an individual or a company, all customers will also want to know how long their departure time will be delayed on average. Through this database, on average, they can figure out how much delay will be and what the variance will be like.

#### 4. E/R Diagram

## 5. Database Implementation

- Data Schemas

- FLIGHT\_PLAN TABLE

- All information can be concentrated on this table. It brings information from 'AIRPLANE', 'JOURNEY', 'CALENDAR', and 'DELAY' tables using foreign keys. These are 'tailnu', 'journey\_id', 'date', and 'delay', which are primary keys in each table and all of them are one-to-many type of relationship.

```
Flight Delay/postgres@spark55
Query Editor Query History Explain Notifications
1 CREATE TABLE FLIGHT_PLAN(
2     Flightnumber INT NOT NULL,
3     Schedtime    INT NOT NULL,
4     Deptime      INT NOT NULL,
5     Tailnu       CHAR(6) NOT NULL,
6     Date         DATE NOT NULL,
7     Journey_ID   INT NOT NULL,
8     Delay        BOOLEAN NOT NULL,
9     PRIMARY KEY (Flightnumber),
10    FOREIGN KEY (Tailnu)
11        REFERENCES AIRPLANE(Tailnu)
12        ON DELETE CASCADE,
13    FOREIGN KEY (Date)
14        REFERENCES CALENDAR(Date)
15        ON DELETE CASCADE,
16    FOREIGN KEY (Journey_ID)
17        REFERENCES JOURNEY(Journey_ID)
18        ON DELETE CASCADE,
19    FOREIGN KEY (Delay)
20        REFERENCES DELAY(Delay)
21        ON DELETE CASCADE);|
```

- AIRPLANE TABLE

- 'FLIGHT\_PLAN' refers to this table using foreign key 'tailnu' by which users can have access to the information regarding each flight including its carrier and the tail number (airplane identifier).

```
Flight Delay/postgres@spark55
Query Editor Query History Explain Notifications
1 CREATE TABLE AIRPLANE(
2     Tailnu CHAR(6) NOT NULL,
3     Carrier CHAR(2) NOT NULL,
4     PRIMARY KEY (Tailnu));|
```

- JOURNEY TABLE

- This table contains all currently operating air travel routes in the data set. Each flight information in 'FLIGHT\_PLAN' table such as its origin and destination can be found using foreign key 'journey\_id'.

 Flight Delay/postgres@spark55 ▾  
 Query Editor Query History Explain Notifications  

```

1 CREATE TABLE JOURNEY(
2     Journey_ID INT NOT NULL,
3     Origin CHAR(3) NOT NULL,
4     Dest CHAR(3) NOT NULL,
5     Distance INT NOT NULL,
6     PRIMARY KEY (Journey_ID));
  
```

○ CALENDAR TABLE

- This table has 1 foreign key ('weather'), and the type of relationship between tables is one-to-many. That is, each value of 'weather' attribute brought from the 'WEATHER' table can be found several times in the 'weather' attribute in the 'CALENDAR' table. This table delivers not only data information but also weather information to 'FLIGHT\_PLAN' table through the channel set by foreign key 'weather'.

 Flight Delay/postgres@spark55 ▾  
 Query Editor Query History Explain Notifications  

```

1 CREATE TABLE CALENDAR(
2     Date DATE NOT NULL,
3     Dayweek INT NOT NULL,
4     Daymonth INT NOT NULL,
5     Weather BOOLEAN NOT NULL,
6     PRIMARY KEY (Date),
7     FOREIGN KEY (Weather)
8     REFERENCES WEATHER(Weather)
9     ON DELETE CASCADE);
  
```

○ WEATHER TABLE

- It has weather categories. Users can see if the weather was bad or not on a specific day by foreign key 'weather'. Besides, they can even tell the weather when a particular flight was in operation through the connection of the three tables, 'WEATHER', 'CALENDAR', and 'FLIGHT\_PLAN'.

 Flight Delay/postgres@spark55 ▾  
 Query Editor Query History Explain Notifications  

```

1 CREATE TABLE WEATHER(
2     Weather BOOLEAN NOT NULL,
3     PRIMARY KEY (Weather));
  
```

○ DELAY TABLE

- It has 'delay' attribute. 'FLIGHT\_PLAN' refers to it using foreign key 'delay' which indicates whether a flight is delayed or not.

 Flight Delay/postgres@spark55 ▾  
 Query Editor Query History Explain Notifications  

```

1 CREATE TABLE DELAY(
2     Delay BOOLEAN NOT NULL,
3     PRIMARY KEY (Delay));
  
```

- Attributes

| Table       | Attribute    | Description  | Datatype              | Default Value | Null     |
|-------------|--------------|--|-----------------------|---------------|----------|
| FLIGHT_PLAN | Flightnumber | Flight identifier<br>ex) 074, 1181   | 3 or 4-digit<br>INT   | .             | Not Null |
|             | Schedtime    | Scheduled flight<br>departure time<br>ex) 1130 (11:30am),<br>2130 (9:30pm)                                 | 4-digit INT           | .             | Not Null |
|             | Deptime      | Actual flight departure<br>time<br>ex) 1135 (11:35am),<br>2137 (9:37pm)                                    | 4-digit INT           | .             | Not Null |
|             | Tailnu       | mentioned in 'AIRPLANE' table details  |                       |               |          |
|             | Date         | mentioned in 'CALENDAR' table details  |                       |               |          |
|             | Journey_ID   | mentioned in 'JOURNEY' table details   |                       |               |          |
|             | Delay        | Mentioned in 'DELAY' table details   |                       |               |          |
| AIRPLANE    | Tailnu       | Airplane identifier<br>number<br>ex) N225DL, N918DE  | 6-letter<br>CHARACTER | .             | Not Null |
|             | Carrier      | Carrier identifier to<br>check the owned<br>company<br>ex) DL, DH  | 2-letter<br>CHARACTER | .             | Not Null |
| JOURNEY     | Journey_ID   | Flight route identifier<br>ex) 1, 2, 3, ...  | INT                   | .             | Not Null |
|             | Origin       | Origin airport<br>ex) IAD, EWR   | 3-letter<br>CHARACTER | .             | Not Null |
|             | Dest         | Destination airport<br>ex) JFK, LGA  | 3-letter<br>CHARACTER | .             | Not Null |
|             | Distance     | Distance between the<br>origin and destination<br>ex) 111, 291   | 3-digit INT           | .             | Not Null |
| CALENDAR    | Date         | Scheduled flight date<br>ex) 1/24/2004,<br>3/1/2004  | DATE                  | .             | Not Null |
|             | Dayweek      | Day of the week of<br>scheduled flight date<br>ex) 1 (Monday), 7<br>(Sunday)                               | 1-digit INT           | .             | Not Null |
|             | Daymonth     | Month of a row's<br>corresponding date<br>ex) 5 (5th), 23 (23th)   | 1 or 2-digit<br>INT   | .             | Not Null |
|             | Weather      | mentioned in 'WEATHER' table details   |                       |               |          |
| WEATHER     | Weather      | Weather information on<br>a scheduled flight date<br>ex) 0 (good for takeoff),<br>1 (not good for takeoff) | BOOLEAN               | .             | Not Null |
| DELAY       | Delay        | If a schedule is delayed<br>ex) 0 (on time) or 1<br>(delay)  | BOOLEAN               | .             | Not Null |

- Primary and Foreign Keys
  - Primary keys for each table

| Table       | Primary key  | Datatype |
|-------------|--------------|----------|
| AIRPLANE    | Tailnu       | CHAR(6)  |
| WEATHER     | Weather      | BOOLEAN  |
| JOURNEY     | Journey_ID   | INT      |
| DELAY       | Delay        | BOOLEAN  |
| CALENDAR    | Date         | DATE     |
| FLIGHT_PLAN | Flightnumber | INT      |

- Foreign keys

| Relationship           | Foreign key | Reference           |
|------------------------|-------------|---------------------|
| CALENDAR → WEATHER     | Weather     | WEATHER(Weather)    |
| FLIGHT_PLAN → AIRPLANE | Tailnu      | AIRPLANE(Tailnu)    |
| FLIGHT_PLAN → CALENDAR | Date        | CALENDAR(Date)      |
| FLIGHT_PLAN → JOURNEY  | Journey_ID  | JOURNEY(Journey_ID) |
| FLIGHT_PLAN → DELAY    | Delay       |                     |

- Actions taken on foreign keys when the corresponding primary key is deleted

| Foreign key | Actions   |
|-------------|---|
| Weather     | Corresponding rows' Weather values automatically deleted    |
| Tailnu      | Corresponding rows' Tailnu values automatically deleted     |
| Date        | Corresponding rows' Date values automatically deleted       |
| Journey_ID  | Corresponding rows' Journey_ID values automatically deleted |
| Delay       | Corresponding rows' Delay values automatically deleted      |

- Records Insertion (Three examples)

AIRPLANE  
TABLE

|   | <div>tailnu</div> <div>[PK] character (6)</div> | <div>carrier</div> <div>character (2)</div> |
|---|---|---|
| 1 | N940CA  | OH  |
| 2 | N405FJ  | DH  |
| 3 | N695BR  | DL  |
| 4 | N662BR  | MQ  |
| 5 | N698BR  | UA  |
| 6 | N687BR  | US  |
| 7 | N321UE  | RU  |

JOURNEY  
TABLE

|   | <div>journey_id</div> <div>[PK] integer</div> | <div>origin</div> <div>character (3)</div> | <div>dest</div> <div>character (3)</div> | <div>distance</div> <div>integer</div> |
|---|---|--|--|--|
| 1 | 1   | BWI  | JFK                                      | 184                                    |
| 2 | 2   | DCA  | LGA                                      | 213                                    |
| 3 | 3   | IAD  | EWB                                      | 229                                    |
| 4 | 4   | DCA  | LGA                                      | 214                                    |
| 5 | 5   | BWI  | JFK                                      | 228                                    |
| 6 | 6   | IAD  | EWB                                      | 213                                    |
| 7 | 7   | BWI  | JFK                                      | 184                                    |
